Jeremy Atkins
CS132 Project 2 Status Report

Using the stl list, the formatted input file is read in and parsed and teams placed into the list. The program defaults to just reading in the given .tsv file for testing purposes, but will be able to read in any properly formatted file named by the user. The list is sorted by division, win percentage, and then alphabetically by team name. Teams can be added and deleted from the list and the list can be printed to the console window formatted. Input validation still needs to be implemented, as well as file output to be read back in. The functionality to play a game still needs to be implemented as well.
